FastAPI study notes

FastAPI lesson

FastAPI is a Python web framework for building APIs using type hints.

Pydantic models validate request data and describe response schemas.

Depends injects shared configuration, authentication and storage services.

An async endpoint can await network I/O through httpx.AsyncClient.

Blocking PDF parsing should run outside the event loop, for example in a process pool.

StreamingResponse sends output chunks incrementally. Server-Sent Events use event and data fields separated by a blank line.

Lifespan initializes resources at startup and closes them at shutdown.
